

SUCCESS and **FAILURE**: Will be used as our boiler plate actions.

LOGIN_SUCCESS and **LOGIN_FAILURE**: Used to update authentication state of the user. **LOGIN_SUCCESS** and **LOGOUT_SUCCESS** will also work here but I like the dichotomy of success and failure.

ADD_PROFILE and **REMOVE_PROFILE**: Used to save the profile data from Auth0 to the global state.

USER_INPUT_CHANGE and **USER_INPUT_SUBMIT**: Used to track the changes and submit of the user submitted text of the form.
